Abstract

Teachers’ quality plays a paramount role in improvement of quality of education. The purpose of this paper is to portray the reflection of expectation and reality from the concept and the implementation CPD activities of primary school teachers in Lubuklinggau, South Sumatera, Indonesia. A qualitative method employed a case study design was used in this study. Questionnaire, in-depth interview, and documentation were used in collecting the data. The result indicated that teachers commonly participated in KKG, In House Training (IHT), and becoming participant in scientific activities such as seminars and workshops in self-development activities. In addition, teachers’ lack of ability as well as lack of access in scientific publications in academic writing was problem of teacher in actuating scientific publications. Futhermore, limited fund and family constrains were common barrier in participating CPD activities.

Keywords: Continuing Professional Development, Primary School Teacher.
INTRODUCTION

Professional development is any attempt to increase teachers’ professional knowledge both during and after the initial preparatory stages in adapting to new skill and updating the previous beliefs to face the development of the world (Alexandrou, 2021). Professional learning is the key component to improving professional practice and embedding fresh perspectives into daily work and behaviors. While most content has remained consistent throughout time, instructional design, educational policy, and classroom tools and structures have been in constant motion (Brown & Gilbert, 2021). However, it is believed that professional development consists of career-building activities that are undertaken by practitioners after they complete their teacher training (Merliza & Retnawati, 2018). A way to ensure high quality teachers is through effective Continuing Professional Development (CPD) for teachers. Teachers face challenges because of school environments. They tend to teach their students independently from their colleagues. Sometimes teachers especially novices become overwhelmed by school bureaucracy demands, and if teachers do not receive insightful feedback or regular supervision, they might become frustrated and less effective. Therefore, professional development activities can solve some of these problematic issues (Siregar, 2018).

Primary education is the cornerstone of formal education around the world. It is the connecting thread between higher levels of learning, instilling in young minds the necessary skills, experiences, and knowledge for a more difficult and higher academic pursuit. The art and act of writing, reading, and the acquisition of necessary skills are all part of primary education. Attitudes and basic information needed for proper adjustment to society and the world in general are provided (Osiesi Mensah Prince, 2020). Primary school is an excellent first step in developing learners' attitudes, which will allow them to develop their future behavior patterns. Primary schools are in charge of teaching basic communication and computing skills that will serve as the foundation for future learning (Wahyudin, 2019).

The Indonesia Ministry of National Education (2012) published the manual book of CPD. It mentioned that teachers in Indonesia should continuously improve their professional competence. There are three things teachers follow in CPD, namely 1), self-development, the activities include functional training, teacher collective activities and competency enhancement activities, 2), scientific publications, the activities include presentations on scientific forums, scientific publications on research in the field of formal education and also publication of textbooks and teacher guidelines, and 3), innovative work, the activities include the discovery of appropriate technology, the discovery or development of artwork, the creation or modification of teaching tools and the preparation of standard questions. CPD for teacher educators is typically initiated upon entry into the profession and continues as a lifelong learning process. There are two common paths for CPD for teacher educators: programs planned and mandated by external agencies and their own initiatives (Tyagi & Misra, 2021). Professional development can also occur in informal contexts such as discussions among work colleagues, independent reading and research, observations of a colleague's work, or other learning from a peer (Mizell, 2020).

CPD has been implemented by teachers and evaluated by researchers around the world. The study conducted by Oliver Heyward et al (2018) revealed CPD must be as long-life learning for teacher in order to match needs and challenges in 21st century education. CPD activities should be planned in systematically, practically, and collaboratively. Therefore, CPD activity can gain teachers optimally in improving their professional competence. In line with CPD, Chew (2016) found that CPD activities has been implemented and teachers needs in providing opportunities of every CPD stage. Teachers found difficulties in finding collaboration in improving their skill and expertise. In addition, CPD activities followed by teacher were only self development activities. Teachers found difficulty in reading and writing scientific journal to reach the scientific publication because of the lackness scientific writing ability (Siregar, 2018).
From the resumes of explanations and studies above, this study portrays Primary School Teachers’ Continuing Professional Development (CPD) in expectation from Indonesia Minister of National Education manual book of CPD activities (self-development activities, scientific publication, and innovative works) and reality of implementation CPD activities from primary school teachers in Lubuklinggau, South Sumatera.

METHODOLOGY

The methodology used in this study was qualitative method employed a case study design. A case study is expected to capture the complexities of a single case, and the methodology for doing so has developed within the social sciences (Ebneyamini & Sadeghi Moghadam, 2018). The data collected through questionnaire, in-depth interview, and documentation. The questionnaire was to find out the activities of CPD followed by primary school teachers, in-depth interview was to investigate primary school teachers’ perceptions about CPD activities, and documentation was to be evidence of what primary school teachers reveal in questionnaire and interview. The participants in this study were 12 teachers from 6 primary schools. In order to establish the trustworthiness, triangulation was used to justify the findings from questionnaire, indepth-interview, and documentation. Triangulation was to compare different findings from different prepective in order to find the valid information (Heale & Forbes, 2017).

RESULT AND DISCUSSION

CPD activities of primary school teachers was revealed by questionnaire. The teacher filled out the questionnaire by giving ticks in CPD activities. The site and the teacher were presented by PS (Primary school) and T (teacher).

Table 1 showed that twelve primary school teachers had undertaken self-development activities. They had participated in KKG (teacher group), In House Training (IHT), and in scientific activities dominantly online seminar and workshop. In Pandemic Covid-19, KKG was not fully active and teachers participated online learning/seminar and workshop. From the twelve teachers, it was only four teachers who had undertaken PPG in-service teacher program.

From the interview, teachers often explained the online learning/ seminar process and PPG in-service program system. one of the teachers stated as indicated in the following interview excerpt:

[…] KKG (teacher group) in Pandemic Covid-19 is not fully active but we are directed from KKG committee in having meeting online, joining seminar online, and discussing online. We think online seminar and workshop are not effective for us because it finds difficulty in understanding materials from the speakers and some seminars are very expensive. In addition, online seminar and workshop are taken by outcam mode and we do another something else unless we will get certificate. PPG in-service program takes long time for us in waiting list. Therefore, we are hopeless and we don’t when we will be participated in that program […] (T13)

In interview process, some teachers had same perceptions of KKG and PPG in-service program. They taught that KKG asked teachers to participate in online seminar and workshop but the activities were not effective for them with virtual communication and they taught that they will be convenience if the seminars or workshops were offline. In the other hand, some teachers deliberated some of online seminar and workshop were expensive for them and school did not accommodate them to participate in that seminars and workshops. In term of scientific publications, it was four teachers who were actively becoming transmitter/interviewee in seminar and publising textbooks. The other teachers revealed reasons why they didn’t actively participate in scientific publication in following interview excerpt:

[…] We feel that scientific publications are not easy to do. We confuse from where we should start to read and write […] (T9)

Based on the statements above, the teachers had gap in actuating their willing to do scientific publication with their ability in academic writing. They confuse with whom they should discuss about scientific publication because KKG activities are rarely in discussing of academic writing. Teachers said that they had their academic writing when they wrote their theses. This condition could be infer that less of facilitator and information made teachers found difficult in actuating scientific publication. In innovative works components, the teacher faced the same problems as in following interview excerpt:

[…] To do innovative works for us is time consuming. There are many things that should be done. We are in a whole-day school and we have family at home. When teaching can be separated from administration works, it is chance for us to learn more in developing innovative work. […] (T5)
Innovative works for teacher was stuck because of time constrain. Teachers taught they should read, learn, and develop innovative works but they do not have enough time for their duty as teacher and their duty as parents. Two of twelve teachers in this study always participated in developing innovative works. They revealed that they had got experiences in developing innovative works when they pursued their master degree (S2). The teacher perceptions above remained that teaching was not a simple profession. Teacher should have deliberation between their duty in teaching and their family time. Along the same line, teacher’s work in the other side, innovative behavior plays a very crucial role in enhancing the performance of schools and society and it should be the main concern of teachers (Hosseini & Haghighi Shirazi, 2021).

Teachers’ professional skills include the ability to plan, implement, and evaluate ongoing learning—teacher training programs to improve teacher competency and performance in schools. The teacher is a blend of personal, scientific, technological, social, and spiritual competencies that contribute to the teacher’s professional competency standards, which include material mastery, student understanding, educated learning, personal development, and professionalism (Prihidayanti et al., 2019). This study found many aspects affected teachers CPD activities especially in Cov-19 Pandemic. Teacher should adapt with this situation not only the innovation of teaching process but also the adaption in professional development. The adaptation was needed to move the ways of communication from direct communication to virtual communication (Nugraha & Maulida, 2021). In term of in-service PPG program, PPG is one of teacher professional development program initiated by government. Teachers upgrade their ability in academic ability and profesional services in education. Easy access in participating PPG will build teachers’ profesional development in providing better teaching and learning process (Arifa & Prayitno, 2019).

Furthermore, teachers’ ability in academic writing was still low. Academic writing will increase writers’ knowledge, critical thinking, and career development (Ntereke & Ramoroka, 2015). Primary school teachers in this study needed training and guidance in implementing academic writing. KKG should take stakeholders as speakers and guidances in academic writing workshop continuously. Access in publishing academic writing in journal was also needed in order to support, motivate, and appreciate teachers in writing. The other benefits for teachers in academic writing, they can share their experiences and methods in teaching and learning process through their writing. The continuous writing will make teachers update with critical education development.

Time constrain became obstruction in CPD activities. CPD activities tooks a lot of time for teachers. They should maintance their time in spending teaching at school and family time at home. Activities that take mothers away from the home, in this case, school, are less important than their responsibilities at home (Kayumova et al., 2015). In contrast, male teachers had more interest in developing their personal ability rather than female teachers (Badri et al., 2016). In personal problem of teaching schedule, it was complex matter that should be faced by teachers.

CONCLUSION

From the result and discussion above, it could be concluded that the primary school teachers in Lubuklinggau had followed CPD activities especially in self-development activities. Teachers commonly participated in KKG, In House Training (IHT), and becoming participant in scientific activities such as seminars and workshops, but some teachers revealed online seminars and workshops were not effective for them. In addition, teachers’ lack of ability in academic writing was problem of teacher in actuating scientific publications as well as lack of access in scientific publications. Furthermore, limited fund and family constrains were common barrier in participating CPD activities.
